

A flowery tale from Vienna

Dr. Andrea Pach, a QUANTEC® user with her own practice in Vienna (Austria), uses her QUANTEC® successfully on her patients. She is now also a “Member of QUANTEC-CONSULTING®”, which corresponds to certification by the firm of QUANTEC® (see also www.quantec.eu, on the left in the menu under QUANTEC CONSULTING® > Coaching)

At the very beginning of her QUANTEC® career, Dr. Pach wanted to test whether one could exclude the pure placebo effect during treatments, and decided to carry out a test with two flower-boxes in front of her house.

The left flower-box was treated with QUANTEC®, but not the right flower-box. The information transmitted to the left flower-box with QUANTEC®

was a mixture of homeopathic preparations and affirmations, including those against aridity and frost. Otherwise the two flower-boxes received exactly the same amounts of water and fertiliser. The lighting conditions were also identical...

The flowers were planted on 5th May; on 14th May – nine days later – they looked as follows:

14th May: Left flower-box, treated with QUANTEC®

14th May: Right flower-box, not treated with QUANTEC®

On 19th May – five days later – the flower-box treated with QUANTEC® had already brought forth its first blossoms.

By 4th June, the left flower-box, treated with QUANTEC®, already had a clear advantage.

On 12th June, after a one-week cold period, the right, untreated flower-box looks in a sorry state. The cold has severely withered the blooms, and the leaves have turned yellow. The cold has clearly not affected the left flower-box.

On 3rd July, after a dry week with very high temperatures, the flowers in the right, untreated flower-box have been even more severely affected.

By 9th July, about two months after planting, the difference is unmistakable:

The right (untreated) flower-box has been able to recover somewhat with regard to colour, although the difference to the left flower-box has become clear to see.

For Dr. Pach, this experience at the beginning of her QUANTEC® career, in addition to the good treatment successes in her practice, formed the cornerstone of her confidence in instrumental biocommunication with QUANTEC®.

19th May: Left, treated flower-box

19th May: Right, untreated flower-box

4th June: Left, treated flower-box

4th June: Right, untreated flower-box

12th June: Left, treated flower-box

12th June: Right, untreated flower-box

3rd July: Left, treated flower-box

3rd July: Right, untreated flower-box

9th July: The right (untreated) flower-box has recovered somewhat with regard to colour, although the difference to the left flower-box is still clearly apparent.
